Freshwater Ecoregions of the World

A partnership between

Major funding for FEOW provided by

Additionally, over 200 scientists made invaluable contributions to this project. A full list of our contributors can be found at feow.org

Freshwater Fish Species Endemism A species is endemic to an ecoregion when it is found only in that ecoregion. If an endemic species is lost from an ecoregion, it is lost globally.

FEOW's maps of endemic freshwater fish species were generated using a database that contains data on over 13,400 fish species. The data show that 6,900 freshwater fish species are found in single ecoregions, and over 40 ecoregions have greater than 50 percent endemism. These results confirm and refine many findings of previous global assessments, including high endemism in large portions of Central Africa; Lakes Malawi, Tanganyika, and Victoria; Asia's Xi Jiang (Pearl River) and Yangtze basins; parts of southeast Asia's Irrawaddy, Salween and Mekong basins; and large portions of South America's Amazon and Orinoco basins. Areas highlighted for the first time include Cuba and Hispaniola, the Amazon's western piedmont, and the Tocantins-Araguaia system.

Freshwater Turtle Species Richness Over 300 turtle species use freshwater habitats around the world, and many are imperiled. As with all other freshwater species, a first step toward conserving turtles is understanding how they are distributed.

The map of freshwater turtle species richness, which shows the number of species present in each ecoregion, was generated from species distribution maps provided by Dr. Kurt A. Buhlmann of the University of Georgia's Savannah River Ecology Laboratory and the IUCN-SSC and CI/CABS Global Reptile Assessment (preliminary results). The source data represent coarse ranges of where species are expected to be present in the wild. Areas that stand out as particularly rich in freshwater turtle species include parts of southeast Asia and much of the southeastern United States.

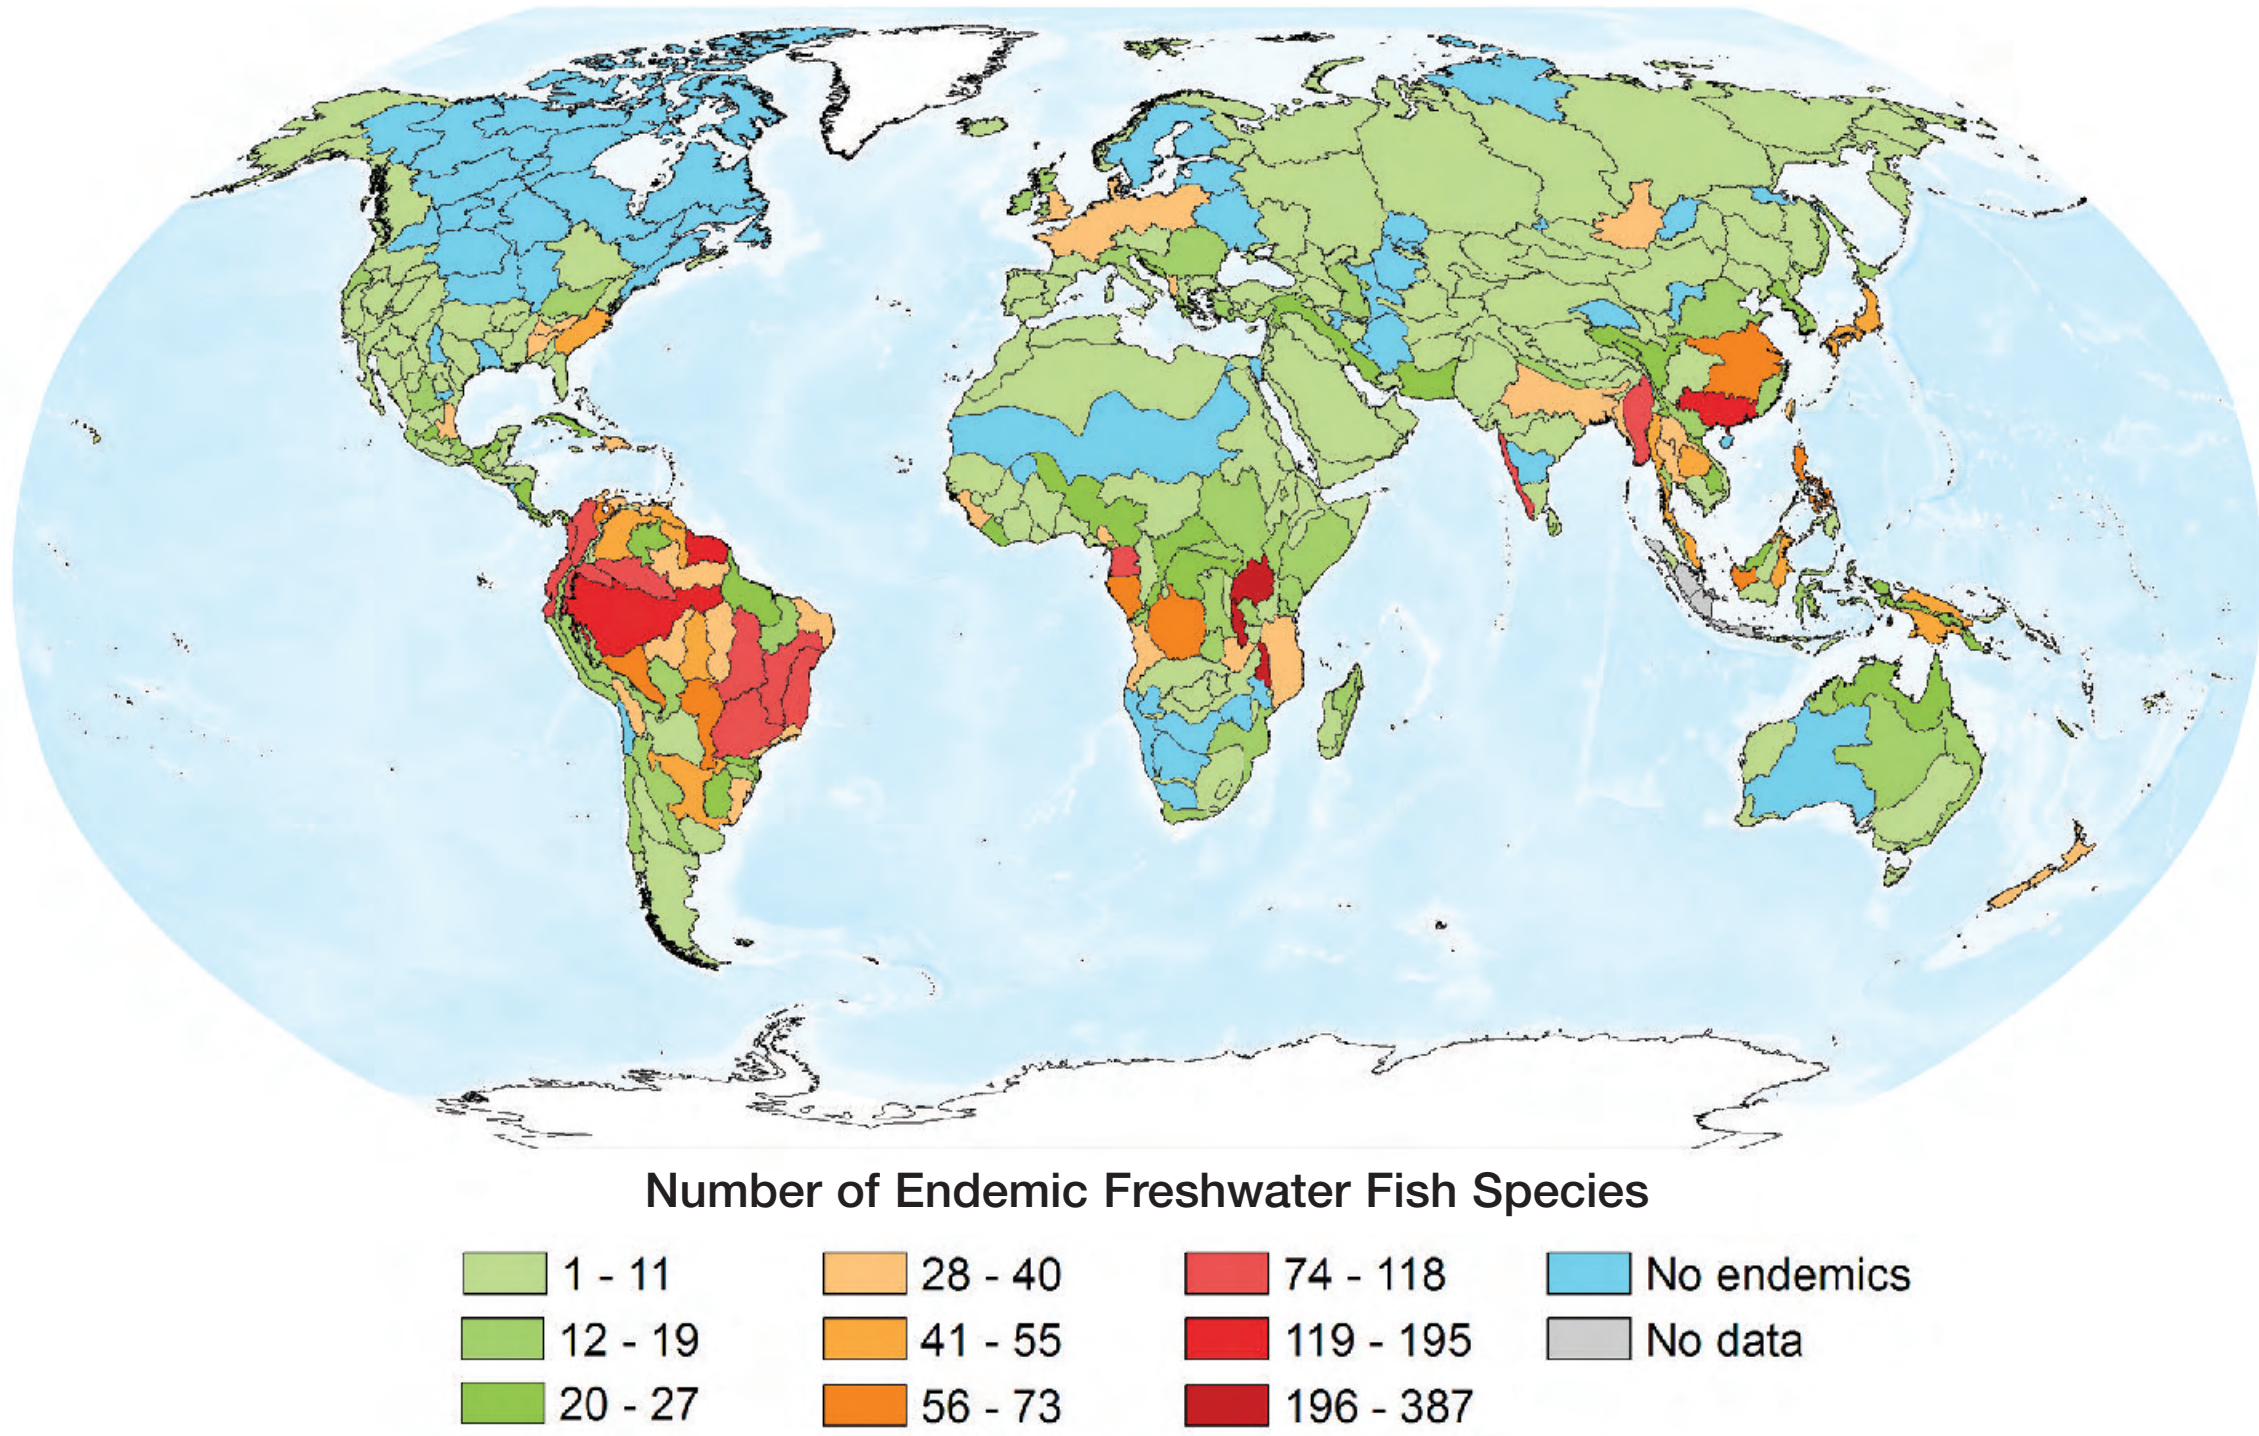

Threatened Freshwater Amphibian Species Of the nearly 6,000 described amphibian species on Earth, more than 4,000 use freshwater habitats during some stage of their life cycles. The Global Amphibian Assessment (GAA) has documented that about one-third of these species are imperiled.

The map of threatened freshwater amphibians displays the number of freshwater amphibian species per ecoregion that are threatened with extinction. The input data are from the GAA, which uses IUCN Red List criteria for assessing extinction risk. Parts of Central America, South America's Andean region, Africa's Niger and Asia's Yangtze basins appear to have the highest concentrations of threatened freshwater amphibians.

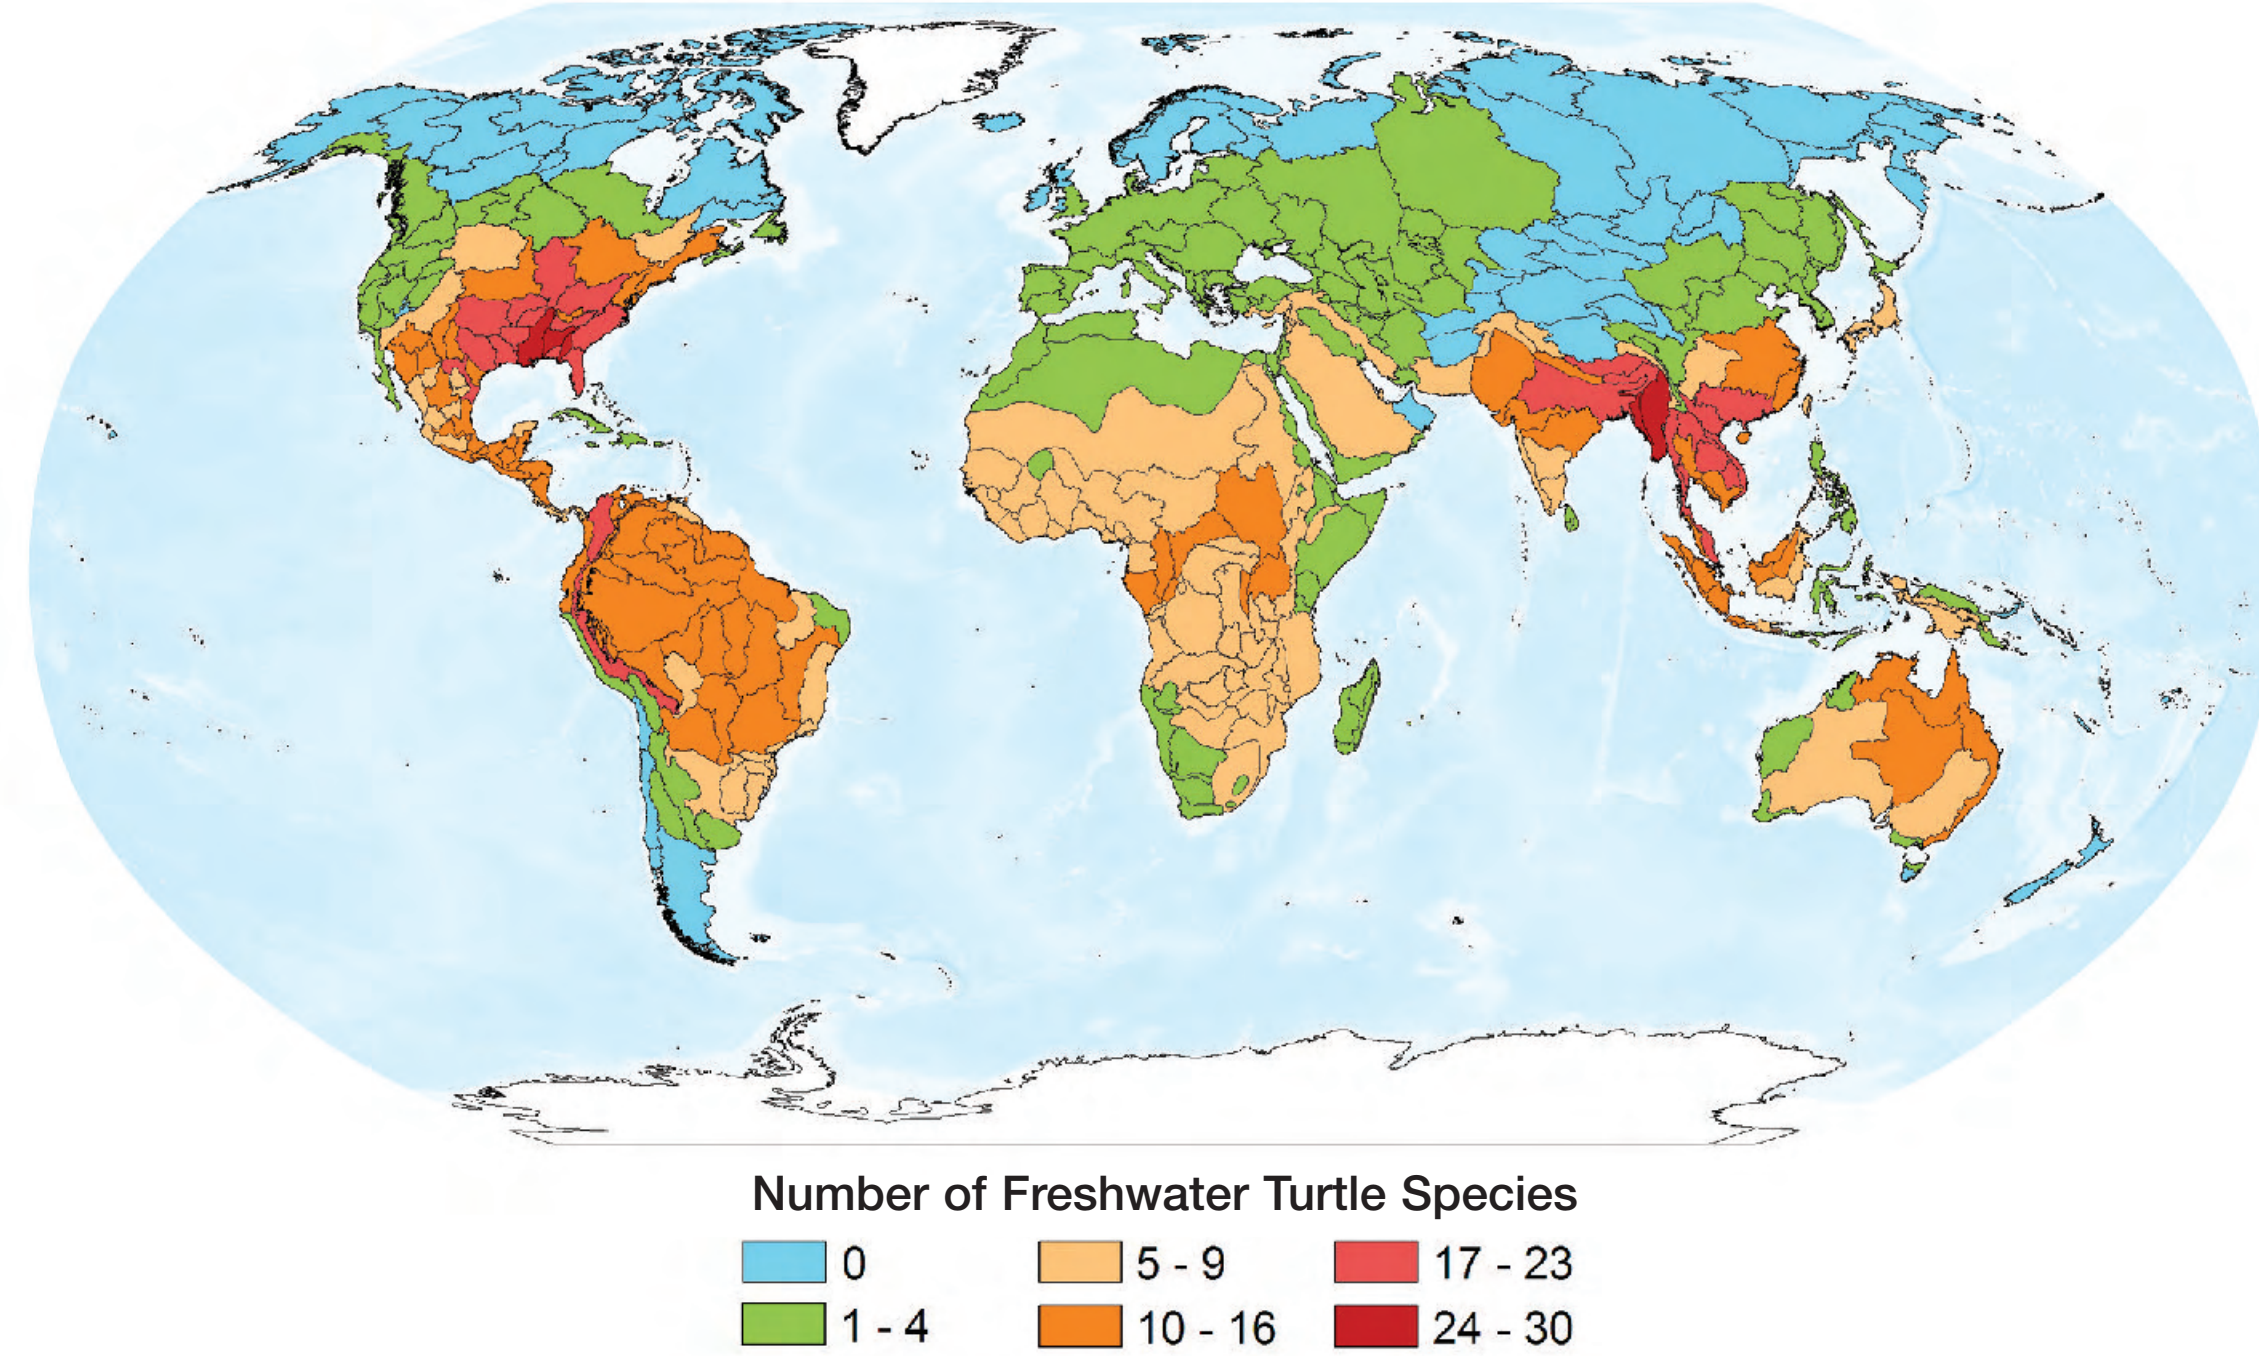

Consumptive Surface Water Use Freshwater systems and species around the world suffer from a range of overlapping threats. Those related to human water use are among the most critical in many regions. Water use analysis can show where surface water abstraction may pose a threat to freshwater systems.

This consumptive surface water use map shows the average annual amount of surface water used in each ecoregion, corrected for ecoregion size. The input data are from WaterGAP, a global hydrologic model developed by the University of Kassel in Germany. The model is restricted to water withdrawn from surface water systems, and considers four water use sectors: industrial, domestic, livestock and irrigation. Consumptive surface water use is highest in western North America and across parts of Western and Central Europe, South and Eastern Asia, and the Middle East.

Freshwater Ecoregions of the World

feow.org

The Nature Conservancy
Protecting nature. Preserving life.™

FEOW provides a new global biogeographic regionalization of the Earth's freshwater biodiversity. Covering virtually all freshwater habitats on Earth, this first-ever ecoregion map, together with associated species data, is a useful tool that can be used to

- identify outstanding and imperiled freshwater systems
- set global and regional conservation priorities
- define appropriate areas for large-scale freshwater conservation plans
- provide a global knowledge base for increasing freshwater biogeographic literacy

FEOW is the result of the combined expertise of more than 200 leading scientists. Covering 426 freshwater ecoregions, it provides analyses of major threats to freshwater systems as well as distribution data for more than

- 13,400 freshwater fish species
- 4,000 amphibian species
- 300 turtle species
- 20 crocodilian species
